

2022 学年九年级学业水平调研 数学试卷参考答案及评分说明

一、选择题：（本大题共 6 题，每题 4 分，满分 24 分）

1. D; 2. B; 3. C; 4. A; 5. B; 6. C.

二、填空题：（本大题共 12 题，每题 4 分，满分 48 分）

7. $\frac{1}{7}$; 8. $a < 1$; 9. $y = (x-1)^2 - 9$ (或 $y = x^2 - 2x - 8$); 10. $>$;
11. $(-1, 0)$; 12. 9; 13. 6; 14. $\frac{2000\sqrt{3}}{3}$; 15. $-\frac{2}{3}\vec{a} - \vec{b}$; 16. $\frac{1}{6}$;
17. 25; 18. $\frac{3\sqrt{10}}{26}$.

三、解答题：（本大题共 7 题，满分 78 分）

19. 解：原式 $= 3 \times 1 \times \frac{\sqrt{3}}{3} + 2 \times \left| \frac{1}{2} - 1 \right| - \frac{1}{\sqrt{3} + 2 \times \frac{\sqrt{2}}{2}}$ (6 分)

$= \sqrt{3} + 1 - (\sqrt{3} - \sqrt{2})$ (3 分)

$= 1 + \sqrt{2}$ (1 分)

20. 解：(1) 由题意得： $\begin{cases} a+b+c=5 \\ c=3 \\ a-b+c=-3 \end{cases}$ (3 分)

可求得 $\begin{cases} a=-2 \\ b=4 \\ c=3 \end{cases}$ (2 分)

$\therefore y = -2x^2 + 4x + 3$ (1 分)

(2) 由配方法可知： $y = -2(x-1)^2 + 5$ (2 分)

$\therefore$ 顶点坐标是 $(1, 5)$ (2 分)

21. 解: $\because$ 四边形 $ABCD$ 为平行四边形,

$$\therefore AD \parallel BC, AD = BC, AB \parallel DC. \quad \dots\dots\dots (1 \text{ 分})$$

$\because$ 点 G 在 BA 延长线上, $\therefore GA \parallel DC$.

$$\therefore \frac{AE}{ED} = \frac{GE}{EC}. \quad \dots\dots\dots (1 \text{ 分})$$

$\because DE = 3AE, CE = 12,$

$$\therefore \frac{1}{3} = \frac{GE}{12}, \quad \dots\dots\dots (1 \text{ 分})$$

即 $GE = 4$. $\dots\dots\dots (1 \text{ 分})$

$$\because AD \parallel BC, \therefore \frac{ED}{BC} = \frac{EF}{FC}. \quad \dots\dots\dots (1 \text{ 分})$$

$$\because DE = 3AE, DE + AE = AD, \therefore \frac{ED}{AD} = \frac{3}{4}. \quad \dots\dots\dots (1 \text{ 分})$$

$$\because AD = BC, \therefore \frac{ED}{BC} = \frac{EF}{FC} = \frac{3}{4}. \quad \dots\dots\dots (1 \text{ 分})$$

$$\because EF + FC = EC, \therefore \frac{FC}{CE} = \frac{4}{7}. \quad \dots\dots\dots (1 \text{ 分})$$

$$\because CE = 12, \therefore \frac{FC}{12} = \frac{4}{7}, \quad \dots\dots\dots (1 \text{ 分})$$

$$\text{即 } FC = \frac{48}{7}. \quad \dots\dots\dots (1 \text{ 分})$$

图 8

22. 解: (1) $Rt \triangle ABC$ 中, $\angle BFC = 45^\circ, BC = 2, \tan \angle BFC = \frac{BC}{BF}, \quad \dots (1 \text{ 分})$

$$\therefore \frac{2}{BF} = 1, \text{ 即 } BF = 2. \quad \dots\dots\dots (1 \text{ 分})$$

$$\because BD = 6, \therefore FD = BD - BF = 4. \quad \dots\dots\dots (1 \text{ 分})$$

$Rt \triangle DEG$ 中, $\angle G = 30^\circ, DE = 2, \tan G = \frac{ED}{DG},$

$$\therefore \frac{\sqrt{3}}{3} = \frac{2}{DG}, \text{ 即 } DG = 2\sqrt{3}. \quad \dots (1 \text{ 分})$$

图 9

$$\therefore FG = FD + DG, \therefore FG = 4 + 2\sqrt{3} \text{ (米)}. \quad (1 \text{ 分})$$

(2) 设 $AH = x$, 根据题意得 $HF = x$, 则 $BH = x - 2$. $\dots\dots\dots (1 \text{ 分})$

$Rt \triangle GHA$ 中, $\angle G = 30^\circ,$

$$\therefore GH = HF + FG = x + 4 + 2\sqrt{3}, \therefore \tan G = \frac{AH}{GH} = \frac{x}{x + 4 + 2\sqrt{3}},$$

$$\therefore \frac{\sqrt{3}}{3} = \frac{x}{x + 4 + 2\sqrt{3}}, \quad \dots\dots\dots (1 \text{ 分})$$

$$\therefore x = 3\sqrt{3} + 5 \approx 10.2 \text{ (米)}. \quad \dots\dots\dots (2 \text{ 分})$$

答: 山峰高度 AH 的长约为 10.2 米. $\dots\dots\dots (1 \text{ 分})$

23. 证明:

(1) $\because AB = AC,$

$\therefore \angle ABC = \angle ACB.$ (1 分)

$\because \angle ABC$ 、 $\angle ACB$ 分别是 $\triangle ADB$ 和 $\triangle BCE$ 的外角,

$\therefore \angle ABC = \angle DAB + \angle D, \angle ACB = \angle EBC + \angle E$ (2 分)

$\because \angle DAB = \angle EBC,$

$\therefore \angle D = \angle E.$ (1 分)

又 $\angle DBF = \angle EBC,$ (1 分)

$\therefore \triangle DBF \sim \triangle EBC.$ (1 分)

图 10

(2) $\because \angle DBF = \angle EBC, \angle DAB = \angle EBC$

$\therefore \angle DBF = \angle DAB.$ (1 分)

$\because \angle D = \angle D,$

$\therefore \triangle DBF \sim \triangle DAB,$ (1 分)

$\therefore \frac{DB}{DA} = \frac{DF}{DB},$ 即 $DB^2 = DA \cdot DF.$ (1 分)

在 $\triangle ADB$ 和 $\triangle BEC$ 中,

$$\begin{cases} \angle D = \angle E \\ \angle DAB = \angle EBC \\ AB = BC \end{cases}$$

$\therefore \triangle ADB \cong \triangle BEC$ (A.A.S), (1 分)

$\therefore BD = EC,$ (1 分)

$\therefore EC^2 = DF \cdot DA.$ (1 分)

24. 解: (1) 根据题意: $\begin{cases} 1-b+c=4 \\ 9+3b+c=-4 \end{cases}$, 可求得 $\begin{cases} b=-4 \\ c=-1 \end{cases}$ (2分)

$\therefore$ 抛物线表达式为 $y = x^2 - 4x - 1$ (1分)

对称轴: 直线 $x = 2$ (1分)

(2) $\because$ 抛物线 $y = x^2 - 4x - 1$ 与 y 轴相交于点 C , $\therefore C$ 点坐标是 $(0, -1)$. (1分)

作 $BM \perp y$ 轴, 垂足为 M . 作 $OH \perp BC$, 交 BC 的延长线于点 H .

$\because B(3, -4)$, $\therefore CM = BM = 3$, $BC = 3\sqrt{2}$, $\therefore \angle MCB = \angle HCO = 45^\circ$.

$\because OC = 1$, $\therefore CH = OH = \frac{\sqrt{2}}{2}$, (1分)

$\therefore BH = BC + CH = 3\sqrt{2} + \frac{\sqrt{2}}{2} = \frac{7\sqrt{2}}{2}$ (1分)

$\therefore \cot \angle OBC = \frac{BH}{OH} = \frac{\frac{7\sqrt{2}}{2}}{\frac{\sqrt{2}}{2}} = 7$ (1分)

(3) $\because BC$ 为直角边, $\therefore$ 只可能有两种情况: $\angle PCB = 90^\circ$ 或 $\angle PBC = 90^\circ$.

设点 P 坐标为 $(x, x^2 - 4x - 1)$

①当 $\angle PCB = 90^\circ$, 作 $PQ \perp y$ 轴, 垂足为 Q . 易得 $PQ = x$, $QC = x^2 - 4x$.

$\because \angle MCB = 45^\circ$, $\angle PCB = 90^\circ$, $\therefore \angle QCP = 45^\circ$,

$\therefore PQ = QC$ (1分)

$\therefore x = x^2 - 4x$, 可求得 $x_1 = 0$ (舍), $x_2 = 5$.

$\therefore P_1(5, 4)$ (1分)

②当 $\angle PBC = 90^\circ$, 同理作 $PT \perp BN$, 垂足为 T , 作 $CK \perp BN$, 垂足为 K .

易得 $PT = 3 - x$, $BT = 4x - x^2 - 3$.

$\because \angle CBK = 45^\circ$, $\angle PCB = 90^\circ$, $\therefore \angle BPT = 45^\circ$,

$\therefore PT = BT$ (1分)

$\therefore 3 - x = 4x - x^2 - 3$, 可求得 $x_1 = 2$, $x_2 = 3$ (舍).

$\therefore P_2(2, -5)$ (1分)

$\therefore$ 综上所述, 点 P 的坐标是 $(5, 4)$ 或 $(2, -5)$.

25. 解: (1) $Rt \triangle ABC$ 中, $\because \angle ACB = 90^\circ$, $\angle B = 30^\circ$, $AB = 4$,

$\therefore \angle A = 60^\circ$, $BC = 2\sqrt{3}$, $AC = 2$ (1 分)

$\because DM \perp AB$, $\therefore \angle ADM = 90^\circ$. $\because AC = 2$, $\angle A = 60^\circ$, $\therefore MD = \sqrt{3}$ (1 分)

由题意易得: $CE = ED = \frac{1}{2}CA = 1$ (1 分)

$\therefore \frac{MD}{ED} = \sqrt{3}$ (1 分)

(2) 由题意可知: $CE = DE$, $CF = DF$, $\angle EDF = \angle C = 90^\circ$, $\therefore \frac{CF}{CE} = \frac{DF}{DE} = y$. (1 分)

$\because \angle MDF + \angle FDB = 90^\circ$, $\angle EDM + \angle MDF = 90^\circ$, $\therefore \angle FDB = \angle EDM$.

$Rt \triangle ADM$ 中, $\because \angle ADM = 90^\circ$, $\angle A = 60^\circ$, $AD = x$,

$\therefore \angle AMD = 30^\circ$, $DM = \sqrt{3}x$, $\therefore \angle B = \angle AMD$, $\therefore \triangle FDB \sim \triangle EDM$ (1 分)

$\therefore \frac{DF}{DE} = \frac{DB}{DM}$ (1 分)

$\because AD = x$, $AB = 4$, $\therefore DB = 4 - x$. $\therefore y = \frac{4\sqrt{3} - \sqrt{3}x}{3x}$ ($4 - 2\sqrt{3} < x \leq 1$) (2 分)

(3) ①当点 M 在线段 AC 上时, $\because \frac{CM}{CE} = \frac{1}{2}$, $\therefore \frac{EM}{CE} = \frac{EM}{DE} = \frac{1}{2}$.

由(2)得 $\triangle FDB \sim \triangle EDM$, $\therefore \frac{FB}{EM} = \frac{FD}{ED}$, 即 $\frac{FB}{FD} = \frac{EM}{ED} = \frac{1}{2}$, $\therefore \frac{FB}{FC} = \frac{1}{2}$ (1 分)

$\because BC = 2\sqrt{3}$, $\therefore CF = DF = \frac{4\sqrt{3}}{3}$, $BF = \frac{2\sqrt{3}}{3}$. 过点 F 作 $FH \perp AB$, 垂足为点 H .

易得 $BH = 1$, $FH = \frac{\sqrt{3}}{3}$, $DH = \sqrt{5}$. $\therefore AD = 3 - \sqrt{5}$ (1 分)

②当点 M 在 AC 的延长线上时, $\because \frac{CM}{CE} = \frac{1}{2}$, $\therefore \frac{CE}{ME} = \frac{DE}{ME} = \frac{2}{3}$.

由题意易证 $\angle M = \angle B$, $\angle EDM = \angle FDB$, $\therefore \triangle EDM \sim \triangle FDB$ (1 分)

$\therefore \frac{ED}{FD} = \frac{EM}{FB}$, 即 $\frac{FB}{FD} = \frac{EM}{ED} = \frac{3}{2}$, $\therefore \frac{FB}{FC} = \frac{3}{2}$ (1 分)

$\because BC = 2\sqrt{3}$, $\therefore CF = DF = \frac{4\sqrt{3}}{5}$, $BF = \frac{6\sqrt{3}}{5}$. 过点 F 作 $FG \perp AB$, 垂足为点 G .

易得 $BG = \frac{9}{5}$, $FG = \frac{3\sqrt{3}}{5}$, $DG = \frac{\sqrt{21}}{5}$. $\therefore AD = \frac{11 - \sqrt{21}}{5}$ (1 分)

综上, $AD = 3 - \sqrt{5}$ 或 $\frac{11 - \sqrt{21}}{5}$.
