

浦东新区2021学年度第二学期初三年级练习题参考答案数学学科

一、选择题：

1. A; 2. D; 3. C; 4. B; 5. C; 6. B.

二、填空题：

7. m^2 ; 8. $(a+3)(a-3)$; 9. $\frac{3}{4}$; 10. $x=5$; 11. 2.487×10^7 ; 12. 9;

13. -6; 14. $\frac{2}{9}$; 15. 10; 16. 130; 17. 7; 18. $\frac{\sqrt{3}}{2}$.

三、解答题：

19. 解：原式 $= 3 + 2 - \sqrt{3} - 5 + 1$.

$$= 1 - \sqrt{3}.$$

20. 解：由①得 $4x \leq 16$.

$$\therefore x \leq 4.$$

由②得 $4x - 2 > 5 - 3x$.

$$\therefore x > 1.$$

$\therefore$ 原不等式组的解集是 $1 < x \leq 4$.

将不等式组的解集在数轴上表示为：

(注：不要漏公共部分)

21. 解：(1) 过点 O 作 $OE \perp AB$ ，垂足为点 E .

在 $\odot O$ 中， $\because OE$ 过圆心， $OE \perp AB$ ，

$$\therefore BE = \frac{1}{2} AB, \angle OEA = \angle OEB = 90^\circ.$$

$$\because AB = 8, \therefore BE = 4.$$

$$\because \angle OPB = 45^\circ, \therefore \angle POE = 180^\circ - 90^\circ - 45^\circ = 45^\circ, \therefore \angle OPB = \angle POE, \therefore PE = OE.$$

$$\because OP = \sqrt{PE^2 + OE^2} = 3\sqrt{2},$$

$$\therefore PE = OE = 3.$$

$$\text{在 Rt}\triangle OEB \text{ 中, } OB = \sqrt{BE^2 + OE^2} = \sqrt{4^2 + 3^2} = 5.$$

(2) 过点 O 作 $OF \perp CD$ ，垂足为点 F .

$$\because CD \perp AB, \therefore \angle CPB = 90^\circ.$$

$$\because \angle OPB = 45^\circ, \therefore \angle OPC = 45^\circ.$$

$$\therefore \angle OPB = \angle OPC. \text{ 又 } \because OE \perp AB, OF \perp CD,$$

$$\therefore OE = OF.$$

$$\therefore AB = CD.$$

22. 解：(1) 设 $y = kx + b$ ($k \neq 0$).

将点 $(0, 40)$ ， $(2, 0)$ 代入，

$$\text{得 } \begin{cases} b = 40, \\ 2k + b = 0. \end{cases}$$

$$\text{解得 } \begin{cases} k = -20, \\ b = 40. \end{cases}$$

甲蜡烛燃烧时 y 与 x 之间的函数解析式是： $y = -20x + 40$.

(2) 由图像可知, 甲蜡烛长 40 厘米, 燃尽需用时 2 小时.

所以甲蜡烛平均每小时燃烧 $40 \div 2 = 20$ (厘米).

因为乙蜡烛每小时比甲蜡烛少燃烧 5 厘米, 所以乙蜡烛每小时燃烧 15 厘米.

因为乙蜡烛比甲蜡烛多燃烧 20 分钟, 所以乙蜡烛燃尽需用时为 $2 + \frac{20}{60} = 2\frac{1}{3}$ 小时.

所以乙蜡烛的高度: $15 \times 2\frac{1}{3} = 35$ 厘米.

答: 乙蜡烛的高度为 35 厘米.

23. 证明: (1) $\because \triangle ABE$ 是等边三角形, $\therefore \angle AEB = 60^\circ$. 又 $\because EF \perp AB$,

$$\therefore AF = \frac{1}{2}AB, \angle AEO = \frac{1}{2}\angle AEB = 30^\circ, \angle AFG = 90^\circ.$$

$\because$ 四边形 $ABCD$ 是正方形, $\therefore AB = CD, \angle BAD = \angle ADC = 90^\circ$.

$\therefore$ 四边形 $AFGD$ 是矩形.

$$\therefore \angle DGO = 90^\circ, DG = AF = \frac{1}{2}AB.$$

$$\because DO = CD, \therefore DG = \frac{1}{2}DO.$$

在 $\text{Rt}\triangle DGO$ 中, $\because \angle DGO = 90^\circ, DG = \frac{1}{2}DO, \therefore \angle DOG = 30^\circ$.

$$\therefore \angle DOG = \angle AEO.$$

$$\therefore AE \parallel DO.$$

(3) $\because$ 四边形 $AFGD$ 是矩形.

$$\therefore AD \parallel EO.$$

$$\therefore \angle ADE = \angle QEF.$$

$$\because AE \parallel DO,$$

$\therefore$ 四边形 $AEOD$ 为平行四边形.

$$\because \triangle ABE \text{ 是等边三角形}, \therefore AE = AB.$$

$$\because \text{四边形 } ABCD \text{ 是正方形}, \therefore AD = AB.$$

$$\therefore AD = AE. \therefore \text{四边形 } AEOD \text{ 为菱形}.$$

$$\therefore AO \perp ED, \therefore \angle AMD = 90^\circ.$$

$$\because EF \perp AB, \therefore \angle AFE = 90^\circ,$$

$$\therefore \angle AMD = \angle QFE, \therefore \triangle AMD \sim \triangle QFE.$$

$$\therefore \frac{EQ}{AD} = \frac{EF}{DM}.$$

(第 23 题图)

24. 解: (1) $\because$ 抛物线 $y = \frac{1}{4}x^2 + bx + c$ 与 y 轴交于点 $C(0, -3)$.

$$\therefore y = \frac{1}{4}x^2 + bx - 3.$$

$\because$ 点 $A(4, 0)$ 在抛物线 $y = \frac{1}{4}x^2 + bx - 3$ 上,

$$\therefore \frac{1}{4} \times 4^2 + 4b - 3 = 0.$$

$$\therefore b = -\frac{1}{4}.$$

∴ 抛物线的表达式为 $y = \frac{1}{4}x^2 - \frac{1}{4}x - 3$.

(2) 当 $y = 0$ 时, $\frac{1}{4}x^2 - \frac{1}{4}x - 3 = 0$. ∴ $x_1 = -3$, $x_2 = 4$.

∴ 点 $A(4, 0)$, ∴ $B(-3, 0)$.

∴ $AB = 7$.

设点 C 到 AB 边的距离为 $h (h > 0)$. ∴ $\frac{S_{\triangle BCM}}{S_{\triangle BCA}} = \frac{\frac{1}{2} \times BM \times h}{\frac{1}{2} \times BA \times h} = \frac{4}{7}$,

∴ $BM : BA = 4 : 7$, ∴ $BM = 4$.

∴ 点 M 在 x 轴上, 且在点 B 的右侧, ∴ $M(1, 0)$.

(3) ∴ 点 D 在线段 OC 上, 过点 D 作 $DE \perp AC$, 垂足为点 E .

在 $\text{Rt}\triangle ACO$ 中, $AC = \sqrt{OC^2 + OA^2} = \sqrt{3^2 + 4^2} = 5$, $\tan \angle ACO = \frac{OA}{OC} = \frac{4}{3}$.

∴ $M(1, 0)$, ∴ $OM = 1$.

∴ $\tan \angle MCO = \frac{MO}{OC} = \frac{1}{3}$.

∴ $\angle CAD = \angle MCO$, ∴ 在 $\text{Rt}\triangle ADE$ 中, $\tan \angle DAE = \frac{DE}{AE} = \frac{1}{3}$.

又 ∴ 在 $\text{Rt}\triangle CDE$ 中, $\tan \angle ACO = \frac{DE}{CE} = \frac{4}{3}$,

设 $CE = 3m (m > 0)$, ∴ $DE = 4m$, $DC = \sqrt{(3m)^2 + (4m)^2} = 5m$.

∴ 在 $\text{Rt}\triangle ADE$ 中, $\tan \angle DAE = \frac{DE}{AE} = \frac{4m}{5-3m}$,

∴ $\frac{4m}{5-3m} = \frac{1}{3}$.

∴ $m = \frac{1}{3}$.

∴ $OD = OC - CD = 3 - 5m = 3 - \frac{5}{3} = \frac{4}{3}$.

(第 24 题图)

25. (1) 证明: 联结 BE .

∴ $AB = BC$, E 是 AC 的中点,

∴ $BE \perp AC$.

∴ $AD \perp AC$,

∴ $\angle AEB = \angle DAC = 90^\circ$.

∴ $AB \parallel DC$,

∴ $\angle BAE = \angle DCA$.

∴ $\triangle ABE \sim \triangle CDA$.

∴ $\frac{AB}{CD} = \frac{AE}{CA} = \frac{1}{2}$.

∴ $DC = 2AB$.

(第 25 题图)

(2) $\because DF \perp BC, \therefore \angle DFC = 90^\circ$.
 $\because \angle DAC = 90^\circ, \angle 1 = \angle 2$.
 $\therefore \angle 3 = \angle 4$. $\because AB = BC, \therefore \angle BAC = \angle 4$.
 $\because AB \parallel DC, \therefore \angle BAC = \angle 5$.
 $\therefore \angle 4 = \angle 5$.
 $\therefore \angle 3 = \angle 5$.
 $\therefore \angle DAC = \angle EAD$.
 $\therefore \triangle ADE \sim \triangle ACD$,

(第 25 题图)

$$\therefore \frac{AD}{AC} = \frac{AE}{AD}.$$

设 $AE = a (a > 0)$, 则 $EC = a, AC = 2a, \therefore AD^2 = 2a^2$.

在 $\text{Rt}\triangle ADC$ 中, $\because AD^2 + AC^2 = CD^2, CD = 2AB = 12$,

$$\therefore 2a^2 + (2a)^2 = 12^2. \therefore a = 2\sqrt{6}.$$

$$\therefore AC = 2a = 4\sqrt{6}.$$

$$\therefore \text{在 } \text{Rt}\triangle ADC \text{ 中, } \cos \angle ACD = \frac{AC}{CD} = \frac{2a}{12} = \frac{\sqrt{6}}{3}.$$

(3) 延长 DF 、 AB 交于点 G .

$\because AG \parallel DC$,

$$\therefore \frac{AG}{DC} = \frac{AE}{EC} = \frac{GE}{DE} = 1, \frac{BF}{FC} = \frac{BG}{GC}.$$

$$\therefore AG = DC = 12.$$

$$\therefore BG = 6. \therefore \frac{BF}{FC} = \frac{1}{2}. \therefore \frac{FG}{DF} = \frac{BF}{FC} = \frac{1}{2}.$$

$$\therefore BF = 2, FC = 4.$$

设 $DE = EG = k (k > 0)$, $\therefore DG = 2k$.

$$\therefore FG = \frac{2}{3}k, DF = \frac{4}{3}k, \therefore EF = \frac{1}{3}k. \therefore EF = \frac{1}{3}DE.$$

(第 25 题图)

①当 $FE = FC$ 时, $\angle FEC = \angle 2$.

$\therefore \angle FEC = \angle BAC, \therefore EF \parallel AB$. 与已知矛盾, 此种情况舍去.

②当 $EC = EF$ 时, $\angle 2 = \angle 3$.

$\because \angle 1 = \angle 2$.

$\therefore \triangle CFE \sim \triangle CAB$.

$$\therefore \frac{CE}{BC} = \frac{CF}{CA}. \therefore CE = 2\sqrt{3}. \therefore EF = 2\sqrt{3}.$$

③当 $CE = CF$ 时, 则 $AE = CE = 4. \therefore AC = 8$.

$$\because DC = 12, \therefore AD = \sqrt{12^2 - 8^2} = 4\sqrt{5}. \therefore DE = \sqrt{AD^2 + AE^2} = 4\sqrt{6}.$$

$$EF = \frac{1}{3}DE = \frac{4\sqrt{6}}{3}.$$

综上所述 $EF = 2\sqrt{3}$ 或 $EF = \frac{4}{3}\sqrt{6}$.
